

Installing Power Mac G5 Bottom Right Cooling Fan Unit

Step 1 - disassembly Side Panel

- To avoid electrocution, shut down the computer. Do not open the computer or attempt to install any items inside it while the computer is on.
- To avoid being shocked wait at least 10 minutes to allow the computer's internal components to cool.

Step 2

- Remove all the cables, including the power cables before opening the unit.

Step 3

- Lift the tab to unlock the side panel.
- The panel should fall out. If the panel does not fall out by itself pull a little from the edges.

Step 4

- Remove the air deflector (the clear plastic cover) by pulling on the handle.

Step 5 - Bottom Right Cooling Fan Unit

- The cooling fan unit is located on the bottom right of the Apple G5 Desktop.

Step 6

- Remove the G5 metal cover from the processing/cooling unit of the computer. NOTE: Apple inserted a rather fragile plastic pin that inserts through the top divider shield and clips into a tab on the hidden ledge of this CPU shield. Removing this pin, certainly voids Mac's warranty - but more appropriate for now, voids most after-market insurance plans. A replacement pin (new) is hard to get ahold of, and very few are talented and patient enough to remove this pin without damaging it. Just something to keep in mind. If you have no warranty any longer or don't care, please continue...
- Pull the metal plate to the left and outward to remove the plate from the processing/cooling unit.

Step 7

- Locate the bottom right fan.

Step 8

- Locate the tabs on the fan unit.
- While pushing in on the tabs, highlighted in yellow, pull the fan back towards the cooling unit.

Step 9

- After the latches are out, pull the fan out.

Step 10

- After removal of the bottom right fan the space should look like this.

To reassemble your device, follow these instructions in reverse order.
